QR CAR

Private contact for parked vehicles

Pakistan pilot proposal

Raazia Imran Reshamwala
Pre-development · October 2026

The parking contact problem

A blocked gate creates a coordination problem.

“Whose car is this?”

Current workaround	A public phone number, a guard calling around, or waiting.
Customer need	Reach the responsible driver without publishing their number.

A private route to the driver

The QR opens a contact page. The service handles the destination.

Scanner	Scan, choose a reason and confirm the request.
Service	Send a private alert and track acknowledgement.
Owner	Respond “Coming” and close the incident after moving.

Proposed product flow. No app or scanner account required for fixed alerts.

The first customer segment

One bounded parking community in Karachi

50–100

consenting owners

1–2 pilot sites
A named staff sponsor
A measurable baseline

Pilot recruitment targets. No sites or users have been acquired.

Pakistan already has competitors

Published product claims and prices, checked 15 October 2026

Offering	Observed emphasis	Price evidence
CarQR	Vehicle contact privacy	Not verified
Amanat	Parking stickers / masking claim	PKR 499 + delivery
TrackMate	Gateway / WebRTC audio	PKR 1,499
Qonnect	WhatsApp QR contact	PKR 1,780*
Nishaaan	Vehicle and asset tags	Not verified

*Qonnect: indexed official content only. Unknown features are not assumed absent.

International product benchmarks

The core idea is established. Local execution must earn its value.

QrMyCar	Private contact with individual and society workflows.
CarQRCode	Stickers with contact and reminder features.
Implication	A QR code or a society dashboard alone is not a moat.

Our differentiation hypothesis

A managed service whose outcomes we can demonstrate

Reachability	Escalation follows human acknowledgement, not delivery alone.
Site operations	Staff can help resolve an incident without a phone directory.
Proof	Measure resolution time, abuse, support effort and cost.

When the owner has no internet

Phase A includes a cellular SMS fallback.

0 s

WhatsApp alert

90 s

SMS if no acknowledgement

180 s

Consented backup if configured

Configurable target timings. No channel guarantees contact with an unreachable phone.

Phase A and Phase B

Messaging first. Local calling follows provider approval.

Release	Committed scope	Launch dependency
Phase A	WhatsApp + SMS, owner and scanner web	Approved messaging routes
Phase B	Verified local masked callback	Carrier / CLI approval
Voice experiment	WhatsApp or browser audio	Separate policy feasibility

WhatsApp voice is not the offline-owner fallback.

Web first, native app later

One responsive experience for the first release

Scanner	Open camera, scan and act in the browser.
Owner and staff	Use a web dashboard with optional PWA installation.
Native application	Reassess after the pilot identifies a concrete need.

Business model experiments

Recurring communication costs require explicit service limits.

Owner plan	Sticker with a defined service period and fair-use allowance.
Site plan	Setup and support, then an active-vehicle service fee.
Premium voice	A capped allowance after measured carrier economics.

Illustrative first-year contribution

PKR per activated owner. Assumptions, not vendor quotations.

999	602	397
selling price	variable cost	contribution

Higher acquisition and delivery costs reduce contribution to PKR 177.

Excludes salaries, taxes, fixed costs and future service liabilities. Voice costs remain unquoted.

A bottom-up market test

A reachable cohort is more useful than an invented national TAM.

1,000

potential activated tags

10 sites
200 vehicles per site
50% opt-in

Illustrative PKR 80 per tag/month = PKR 80,000 gross MRR

Scenario assumptions. No traction, conversion or recurring revenue claimed.

Two, four and eight weeks

Baseline: two developers at 20 focused hours each per week

2 weeks	Demonstration, secure core flow and provider feasibility.
4 weeks	Controlled Phase A pilot if messaging and safety gates pass.
8 weeks	Pilot hardening and conditional Phase B local calls.

The pilot evidence we need

Targets for learning, not current performance

Measure	Proposed target
Tag activation	At least 70% of distributed tags
Owner acknowledgement	80% within 3 minutes in controlled incidents
Privacy test	Zero public phone leaks in defined checks
Commercial evidence	Two site buyers discuss paid continuation

Report sample size, failures, network conditions and drills separately.

Risks that can change the plan

Development effort is only one part of launch readiness.

Provider dependency	Validate SMS, templates and local caller ID before promises.
Privacy and abuse	Audit public data, limit contact attempts and cap spend.
Business viability	Test renewal willingness and actual support cost.

The pilot partnership request

A site sponsor, a small consenting cohort and measured results

1 site sponsor

50–100 consenting owners

Proposed Phase A cash envelope: PKR 42,000–114,000

Planning range only. Founder salaries and Phase B carrier deposits excluded.

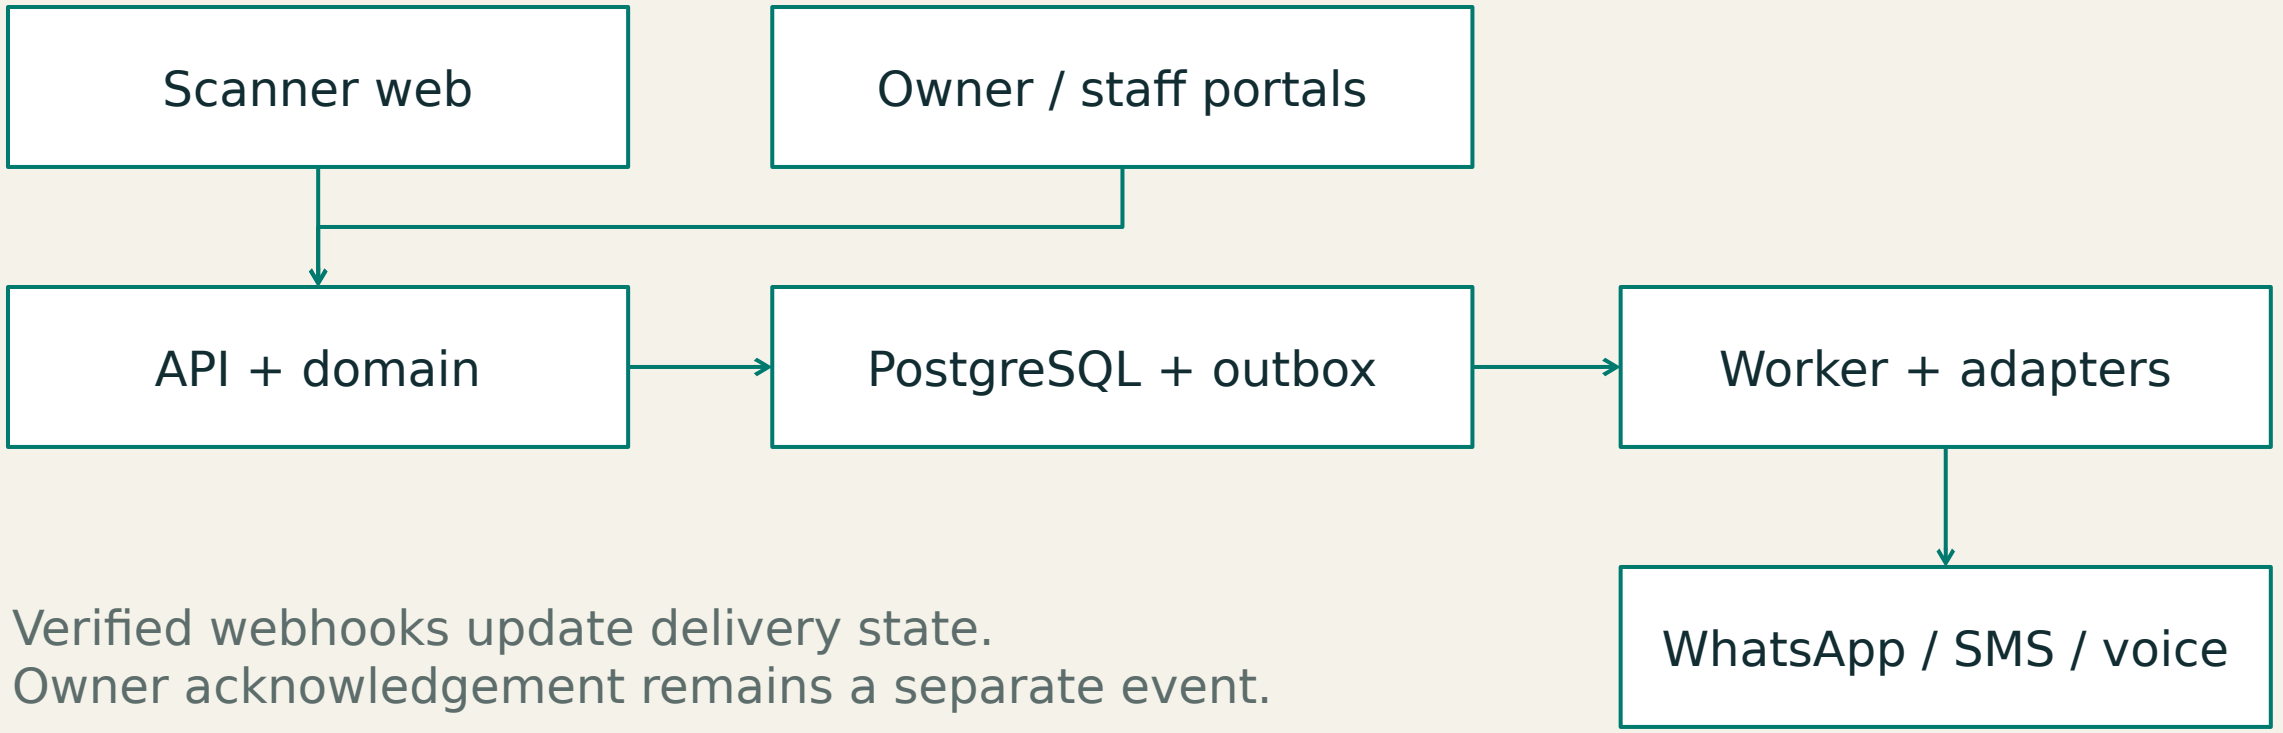

Appendix · Roles and permissions

Six roles, with separate support and fulfilment permissions

Role	Core responsibility
Scanner	Submit and follow their own request
Owner / driver	Claim tag, manage contacts, acknowledge
Backup contact	Receive only agreed escalations
Guard / site operator	Assist with site incidents
Site administrator	Manage staff and aggregate site outcomes
Platform administrator	Fulfilment, abuse, provider health and audit

Appendix · System architecture

A modular application with a durable worker

Verified webhooks update delivery state.
Owner acknowledgement remains a separate event.

Appendix · Technology choices

Small footprint, explicit boundaries

Layer	Proposed implementation
Web and API	Next.js, TypeScript, Tailwind
Data	PostgreSQL with Prisma migrations
Background work	Node worker, Redis and BullMQ
Communications	Official WhatsApp, contracted SMS, approved voice
Operations	Containers, CI, secrets, backups and monitoring

Appendix · Connectivity boundaries

Offline does not mean the same thing for every channel.

Owner condition	Possible response path
Internet + cellular available	WhatsApp, SMS and later local call
Mobile data off, cellular available	SMS reason in body and later local call
Phone off or no cellular coverage	Consented backup or site assistance
Scanner also has no internet	Web alert cannot submit

No promise of guaranteed reachability or emergency dispatch.

Appendix · Privacy controls

The phone number stays out of the public interface.

Public access	Random token, minimal response and no owner contact links.
Ownership	Separate sealed claim secret plus verified contact.
Operations	Consent, role checks, audit, rate limits and retention.

Appendix · Physical tag and maps

A sticker is a contact entry point, not a GPS tracker.

Sticker	Inside-glass sample, readable official domain and sealed claim.
Quality	Test actual printed codes through glass before bulk production.
Location	Optional incident context with short retention. No live tracking.

Appendix · Release gates

A demonstration and a live service require different evidence.

Demo	Safe end-to-end flow. Any simulation visibly labeled.
Phase A pilot	Approved routes, offline-owner test, privacy and restore checks.
Phase B pilot	Carrier permission, real handset masking and cost controls.
